How to Use catWhatsapp Software

Step 1: Download the Software

Download the ZIP package from the official link:

http://twostars.co.in/whatsapp/pages

Step 2: Generate Your Personal Authentication File

Obtain your personal hash.dat file by visiting:

https://twostars.co.in/whatsappApi.html

Step 3: Prepare the Installation Directory

Create a folder on your computer where you would like to set up the software (referred to as the base folder).

Step 4: Extract and Set Up Files

- Extract the contents of the downloaded ZIP file into the base folder.

- Place the hash.dat file inside this same base folder.

IMPORTANT: Do not rename or modify any of the default folders or files. The application relies on specific folder and file names to function properly.

Step 5: Launch the Application

Run the catWhatsapp.exe file. A QR code will appear on the screen.

- Open WhatsApp on your mobile device.

- Navigate to Linked Devices and scan the QR code to connect your account.

Step 6: Send Messages via XML

After the initial setup, the application will automatically create a folder named watch_folder.

- Place your .xml files containing messages into this folder.

- The application will process and send messages based on the contents of these files.

Step 7: Reuse Without Re-Scanning

You do not need to scan the QR code every time you restart your computer. Once your device is linked:

- Simply run catWhatsapp.exe again.

- Add your new .xml files into the watch_folder to continue sending messages.
